BIRD Release Overview

What is new, what has changed and how to access the November 2026 BIRD content.

Release information	
BIRD Release	November 2026
Publication date	02 November 2026
Compared with	March 2026 BIRD publication
BIRD (E)LDM	6.8.1

RELEASE AT A GLANCE

The November 2026 release marks the transition to a new BIRD operational framework supported by a dedicated ESCB service. It provides users with updated BIRD content, enhanced metadata model (SMCube2.0), enhanced documentation and new ways to access and use published metadata.

1. About this release

This release overview is the starting point for exploring the November 2026 BIRD release.

It highlights the main developments introduced with the release and directs users to the relevant published content and documentation.

The focus is on changes that are relevant from a BIRD user perspective.

2. A new BIRD operational framework

The November 2026 release marks the transition to a new operational framework for the maintenance and publication of BIRD content.

The new framework supports a new sustainable management of BIRD content, with strengthened processes for its preparation, review, validation and publication.

WHAT THIS MEANS FOR BIRD USERS

For BIRD users, the new framework translates into reviewed and more consistent metadata, enhanced documentation and new ways to access and use published BIRD metadata.

3. What is new in this release

3.1 A new enhanced version of the metadata model

The BIRD metadata model has undergone a major upgrade from SMCube 1.0 to SMCube 2.0. This significant milestone introduces powerful new metadata capabilities, enhancing the documentation, exploration and understanding of BIRD content, including the ability to track metadata changes over time.

Important for existing users: This upgrade brings substantial changes to the underlying metadata structure. Users relying on BIRD technical exports will therefore need to adapt their existing solutions accordingly.

Comprehensive documentation on SMCube 2.0, including details of the new metadata structure and the changes introduced, is available in the **About BIRD** section of the Website in the rubric BIRD metadata and documentation.

UPGRADE

Explore SMCube 2.0 and discover its enhanced capabilities in the **About BIRD** section.

3.2 A new downloadable BIRD SQLite database

A new SQLite database is available for download as part of the BIRD documentation.

It offers users a new and additional way to access and use BIRD content, beyond browsing the Website or consuming the APIs. The database contains published metadata available in a structured, relational, and machine-readable format that users can query and further process.

NEW PRODUCT

Download the BIRD SQLite database to query the metadata of the November 2026 release in a relational database.

3.3 Metadata aligned with the new BIRD metadata model

BIRD metadata was extensively reviewed and adapted to the enhanced SMCube 2.0 metadata model.

The November release incorporates the outcome of the review and consolidation work performed during the transition to the new BIRD framework.

This includes a review of the structures and relationships used to represent BIRD content, with the objective of improving consistency, clarity and traceability across the model.

The published metadata therefore reflects both the new information model and a broader revision of how BIRD information is structured and represented, including more explicit logical generation and derivation transformation rules.

3.4 Reviewed and enhancement of BIRD business content

The business content underlying the BIRD models was reviewed.

The review covered the way business concepts and reporting requirements are represented in BIRD, ensuring that the published content is consistent with the revised information model and the new BIRD framework. This provides a more robust basis for maintaining and extending BIRD content in future releases.

This work resulted in refinements to the Logical Data Model (LDM) and the Input Layer (IL), as well as enhancements to the transformation logic for the reporting frameworks currently in scope.

In particular, the Derivation and Generation transformation Rules for FINREP, Asset Encumbrance and AnaCredit have been enhanced through the introduction of algorithms expressed in pseudo-SQL format. This allows for a more granular representation of transformation logic, including OR and nested conditions, while ensuring full traceability of metadata lineage between source and destination variables and cubes.

These enhancements to the transformation logic have been accompanied by the corresponding refinements to the input structures, namely the Logical Data Model (LDM) and the Input Layer (IL).

Furthermore, transformations between the Logical Data Model and the Input Layer have been explicitly represented in the tabular structure through dedicated transformation rules.

BIRD Logical data model updates

As part of the overall review of BIRD business content, targeted enhancements were introduced to the BIRD Logical Data Model (LDM) to improve its overall quality and ensure the correct implementation of transformation rules for the reporting frameworks currently in scope (e.g. FINREP). These enhancements included, among others, the introduction of haircuts for exchange-traded derivatives, a review of the applicability of the Held for Sale attribute, and the inclusion of the encumbered asset amount.

3.5 Updated and enhanced BIRD manuals

The BIRD manuals and documentation were substantially updated, both in content and in the level of guidance provided to users.

The revised manuals and documentation provide more comprehensive explanations and practical guidance to help users understand BIRD concepts, models and metadata.

For example, the documentation introducing the Logical Data Model (LDM) was enriched with significantly more examples, making the underlying modelling concepts easier to understand and apply.

ENHANCED DOCUMENTATION

The updated manuals and documentation provide richer explanations, additional examples and improved guidance to support users in understanding the new BIRD framework.

3.6 A new BIRD Business Manual

The "BIRD business requirements implementation guide" is a new addition to the BIRD documentation.

It complements the existing methodological and modelling documentation by providing a dedicated business perspective on the BIRD content.

The manual explains how business and reporting requirements are treated within BIRD and supports users in understanding the business rationale behind the published content.

Perspective	Main document
Business users	BIRD business requirements implementation guide / BIRD LDM - domain guide
Methodology and modelling topics	SMCube Information Model / BIRD LDM design principles / BIRD LDM – introduction to data modelling
Reading metadata	BIRD metadata manual
Published content	BIRD Website

3.7 Enhanced discovery through the BIRD Website

The BIRD Website provides the main entry point for exploring the published BIRD content.

The enhanced BIRD Website improves access to BIRD metadata and supporting documentation and provides new capabilities for navigating, exploring and understanding relationships across BIRD content.

- Metadata navigation
- Lineage information
- Logical Data Model visualisation
- Access to validation rules
- Metadata versioning and access to historical information
- Downloadable BIRD content and improved API
- Access to the updated BIRD manuals

4. Explore the November 2026 release

The November release provides complementary ways to access, understand and use BIRD content.

What do you want to do?	Where to go
Get an overview of the main developments	Overview of the content changes introduced in the BIRD Release overview available in the BIRD metadata and documentation rubric on the BIRD Website
Browse published BIRD content	The Navigator on the BIRD Website
Understand the changes from SMCube 1.0 to SMCube 2.0	Transition from SMCube 1.0 to SMCube 2.0 documentation on the BIRD Website
Download and process BIRD metadata	BIRD SQLite database / APIs
Understand the business treatment of BIRD content	BIRD business requirements implementation guide available in the BIRD metadata and documentation rubric on the BIRD Website
Understand the LDM and other modelling concepts	BIRD methodology and reference documentation and The BIRD LDM domain guide available in the BIRD metadata and documentation rubric on the BIRD Website
Explore relationships across BIRD content	BIRD Website – lineage and visualisation features in the BIRD Navigator

NOVEMBER 2026 RELEASE AT A GLANCE

Enhanced Metadata Model: explore our transition documentation from SMCube 1.0 to SMCube 2.0 in the BIRD Website.
New product: downloadable SQLite database.
Reviewed content: metadata aligned with the new metadata model and improved business content with more explicit generation and derivation logical transformation rules.
Enhanced documentation: updated manuals with richer content and more examples.
New documentation: BIRD Business requirement implementation guide.
Enhanced access: BIRD Website with improved navigation, lineage, historisation and visualisation capabilities.
